

Findings and Visualization of WeRateGogs Twitter Archive

- The most predicted dogs are Golden_retriever, Labrador_retriever, and Chihuahua

As the three prediction models, we can see the mentioned dog breeds are the most likely to be predicted. This implies that the dogs are famous since most of the images attached to the tweets are likely to be these types of dogs.

- **We have a very strong correlation between Retweets and Favorites of around 92%**

With the increase in the retweet count, there is also a significant increase in the favorite count. This implies that if a tweet is famously based on the retweet count, it is close to certain that it will have a high favorite count also.

- **The average numerator rating for the dogs is 10.99**

Since the denominator rating is always 10. The numerator rating is important to determine the rating of a dog. On average most of the tweets had a rating of 10.99, which is slightly higher than the base value of 10. We also have an extreme case where a dog was given a rating of 75.

- **Pupper is the most common word used in most tweets**

We can also note from the analysis of the Tweet text via Word Cloud that the word Pupper is the most common. This implies that the majority of the tweets will always have the word. Pupper being a small dog almost maturing into a Doggo, it is highly likely that most people may have their dogs at this stage.
